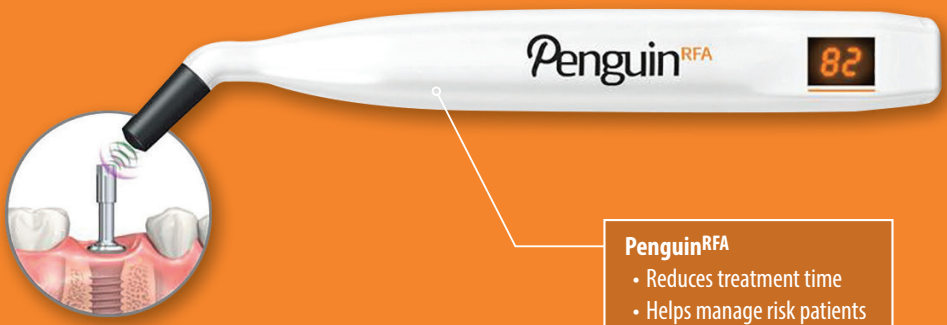
implant Solutions®

Measure primary implant stability and osseointegration with Penguin RFA.



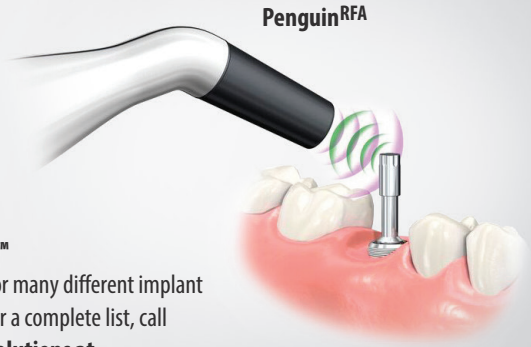
Penguin RFA
- Reduces treatment time
- Helps manage risk patients

Penguin RFA

20 Years of History: RFA Technique

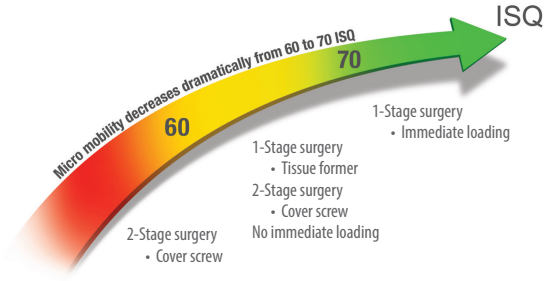
More than 20 years ago, Resonancy Frequency Analysis (RFA) and ISQ (Implant Stability Quotient) were introduced to implant dentistry. RFA is a method used to determine implant stability in dental implants which can help reduce patient treatment time and manage risky patients.

When the MulTipeg™ is attached to an implant, the MulTipeg™ vibrates.



MulTipeg™
Available for many different implant systems. For a complete list, call **Implant Solutions at 1.800.995.0626**

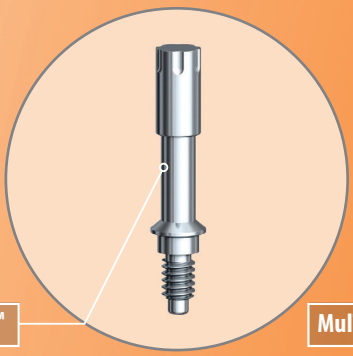
The frequency of the vibration is picked up by the Penguin RFA instrument and translated into an Implant Stability Quotient (ISQ) scale value between 1 and 99. The higher the ISQ value, the better the stability.



A summary of over 500 publications. For more information, contact Implant Solutions at 1.800.995.0626.

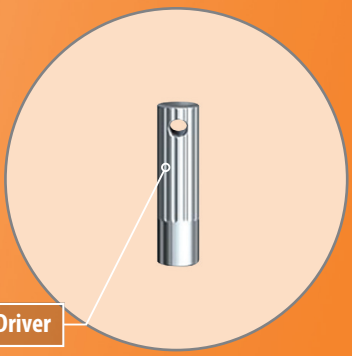
Get started today.

To begin, you will need the Penguin[RFA] Instrument kit and MulTipegs.



MulTipeg™

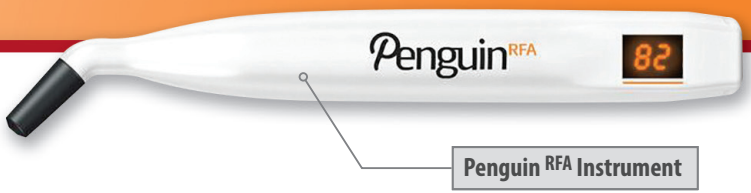
- Reusable
- Autoclavable
- Calibrated
- Available for many different implant systems. For a complete list, call Implant Solutions.



MulTipeg™ Driver

- Reusable
- Autoclavable
- Stainless steel

If you are working under sterile conditions you will also need sterile covers.



Penguin [RFA] Instrument

- Handheld
- Rechargeable
- Accurate

More than 700 articles on the Resonance Frequency Analysis (RFA) technique have been published in scientific journals since 1996. For more information, contact Implant Solutions at 1.800.995.0626.
